

# Python on Mac

## *REST APIs with Flask and Python*

Let's look at installing Python on Mac.

To install Python, download Python 3.5 (or higher) from <http://www.python.org>.

Once Python is installed, you can execute the program `Terminal.app`. All Mac computers have this program—it is a command-line interface to your computer. Here, just type the word `python3.5` and that will start the Python program.

If you cannot find `Terminal.app`, look under `/Applications/Utilities/`, it can normally be found there.

At all points during the course, you can always type `python3.5 name_of_file.py` and that will execute the code of a file called `name_of_file.py`.

Kind regards,

Jose
